Project GPT Exercises Beginner Level

Exercises 1–4: Purpose, Role, Scope & Output Format

Based on: How to Build Your Own Project GPT — A Generic Framework

Exercise 1

Step 1 — Define Purpose

Write Your GPT Purpose Statement

Step 1 — Define Purpose

REAL-WORLD SCENARIO

You work at a small bakery. You receive 30+ WhatsApp inquiries daily about orders, pricing, and availability. You want to use a Project GPT to help manage responses.

INSTRUCTIONS

1. Write a one-sentence purpose statement using the formula: 'This Project GPT helps me with ____ by doing ____.'
2. Identify exactly one primary task your GPT will do.
3. List up to 3 secondary tasks (optional).
4. Rewrite any 'bad' purpose statement you see into a 'good' one.

EXPECTED OUTCOME

A clear, single-purpose statement like: 'This Project GPT helps me with bakery customer inquiries by drafting accurate, friendly WhatsApp replies about orders and pricing.' You should be able to tell instantly if a task is in or out of scope.

Exercise 2

Step 2 — Define Role

Craft a Role Identity for Your GPT

Step 2 — Define Role

REAL-WORLD SCENARIO

You are a freelance resume writer. You help clients improve their CVs. You want a GPT that reviews resumes and suggests improvements.

INSTRUCTIONS

1. Write a role statement using: 'You are a [role] with [experience] who specializes in [area].'
2. Explain in 2-3 sentences why this role identity matters for output quality.
3. Write one 'weak' role statement and one 'strong' role statement, then compare them.

EXPECTED OUTCOME

Strong example: 'You are a professional resume consultant with 15 years of experience in tech hiring who specializes in transforming generic CVs into achievement-focused documents for software engineers.' Compare this to 'You are a helpful assistant.' — the first gives GPT a decision-making lens.

Exercise 3

Steps 3 & 4 — Scope and Input

Build Your Do / Don't List

Steps 3 & 4 — Scope and Input

REAL-WORLD SCENARIO

You run a travel agency and want a GPT that helps write personalized trip itineraries for clients based on a short brief.

INSTRUCTIONS

1. Create a SHOULD list with at least 5 items.
2. Create a SHOULD NOT list with at least 5 items.
3. Define the exact input format users will use (paste text, answer questions, etc.).
4. Write the instruction sentence: 'When the user gives input, always treat it as ____.'

EXPECTED OUTCOME

Example: SHOULD — Ask for destination, budget, travel dates, and traveler count before generating. Organize output by day. SHOULD NOT — Never invent hotel names. Never assume dietary preferences. Input format: 'User pastes a brief: Destination / Budget / Dates / Interests.'

Design a Consistent Output Template

Step 5 — Output Format

REAL-WORLD SCENARIO

You are a product manager who wants a GPT to help write user stories from feature requests submitted by the engineering team.

INSTRUCTIONS

1. Define the exact output structure your GPT should always use.
2. Choose your format type: bullets, numbered steps, table, headings, or JSON.
3. Write a sample 'ideal output' for one feature request.
4. Identify what would make an output 'bad' — and write that version too.

EXPECTED OUTCOME

Good structure: 1. User story (As a... I want... So that...) 2. Acceptance criteria (bullet list) 3. Edge cases 4. Priority (High/Medium/Low). Bad output: a wall of text with no structure, missing acceptance criteria, or invented technical details.
